

3.2 Bayes' Rule

Monday, 10 October 2022 12:56

Summary	<ul style="list-style-type: none">Bayes' Rule																																		
<ul style="list-style-type: none">Prior probabilityPosterior probabilityWhere does Bayes' rule fit into this?	<div>Baye’s rule</div> <ul style="list-style-type: none">Often we have initial guesses about an event from which we can calculate prior probabilities, using the usual probability theory.Then, from sources such as data collection, sample, product field tests, we obtain more information about these events.Given, this new information, we can update our prior beliefs by calculating revised probabilities – this is called the posterior probability.Baye’s rule is used to calculate the posterior probability if we have the initial belief (probability) and the additional sample information.																																		
	<div>Baye’s rule</div> <ul style="list-style-type: none">Suppose that a manufacturer receives same raw material from two different suppliers <i>S1</i> and <i>S2</i>.Currently 65% of the raw material comes from <i>S1</i> and remaining, 35%, comes from <i>S2</i>.Also, suppose that from the historical data available with the quality assurance department, we know that <i>S1</i> has 98% of the supplied raw material of good quality and <i>S2</i> has 95% of the raw material of good quality.That is, the probability of a “Good” quality raw material given that the supplier is <i>S1</i> is, <i>Pr(G/S1) = 0.98</i>. And for the second supplier, this probability is: <i>Pr(G/S2) = 0.95</i>. <div><table><tr><td>65% of the raw material comes from S1</td><td>35% of the raw material comes from S2</td></tr></table><table><tr><td></td><td>S1</td><td>S2</td><td></td></tr><tr><td>Good</td><td>98% of S1 P(G S1)</td><td>95% of S2 P(G S2)</td><td></td></tr><tr><td>Bad</td><td>2% of S1 P(B S1)</td><td>5% of S2 P(B S1)</td><td></td></tr><tr><td></td><td>P(s1) = 65%</td><td>P(S2) = 35%</td><td></td></tr></table><table><tr><td></td><td>S1</td><td>S2</td><td></td></tr><tr><td>Good</td><td>0.98×0.65</td><td>0.95×0.35</td><td></td></tr><tr><td>Bad</td><td>0.02×0.65</td><td>0.05×0.35</td><td></td></tr><tr><td></td><td>0.65</td><td>0.35</td><td></td></tr></table></div>	65% of the raw material comes from S1	35% of the raw material comes from S2		S1	S2		Good	98% of S1 P(G S1)	95% of S2 P(G S2)		Bad	2% of S1 P(B S1)	5% of S2 P(B S1)			P(s1) = 65%	P(S2) = 35%			S1	S2		Good	0.98×0.65	0.95×0.35		Bad	0.02×0.65	0.05×0.35			0.65	0.35	
65% of the raw material comes from S1	35% of the raw material comes from S2																																		
	S1	S2																																	
Good	98% of S1 P(G S1)	95% of S2 P(G S2)																																	
Bad	2% of S1 P(B S1)	5% of S2 P(B S1)																																	
	P(s1) = 65%	P(S2) = 35%																																	
	S1	S2																																	
Good	0.98×0.65	0.95×0.35																																	
Bad	0.02×0.65	0.05×0.35																																	
	0.65	0.35																																	
	<div>Baye’s rule</div> <ul style="list-style-type: none">What is the probability of the raw material being supplied by <i>S1</i> and it being good?Joint probability, of course!This can be calculated using the Baye’s formula. <i>Pr(S1, G) = Pr(S1 ∩ G) = Pr(S1)*Pr(G/S1) = 0.65*0.98 = 0.637</i> <i>Pr(S2, G) = Pr(S2 ∩ G) = Pr(S2)*Pr(G/S2) = 0.35*0.95 = 0.3325</i>Now, knowing all this information so far, suppose the manufacturer inspects the incoming raw material on receipt and finds a bad quality material.He wants to know the supplier who needs to be contacted to complain! <div><table><tr><td></td><td>S1</td><td>S2</td><td></td></tr><tr><td>Good</td><td>0.637</td><td>0.3325</td><td>0.9695</td></tr><tr><td>Bad</td><td>0.013</td><td>0.0175</td><td>0.0305</td></tr><tr><td></td><td>0.65</td><td>0.35</td><td>1</td></tr></table></div>		S1	S2		Good	0.637	0.3325	0.9695	Bad	0.013	0.0175	0.0305		0.65	0.35	1																		
	S1	S2																																	
Good	0.637	0.3325	0.9695																																
Bad	0.013	0.0175	0.0305																																
	0.65	0.35	1																																
<ul style="list-style-type: none">State Bayes' Rule	<div>Baye’s rule</div> <ul style="list-style-type: none">We are interested in the posterior probability that a particular supplier is guilty of supplying bad quality product <i>given that</i> we have bad quality raw material at our doorstep – <i>Pr(S1/B)</i> or <i>Pr(S2/B)</i>.This is an application of Baye’s theorem – finding posterior probability given some initial facts and numbers.From Baye’s formula we know that: <div>$\Pr(S1 B) = \frac{\Pr(S1 \cap B)}{\Pr(B)}$$\Pr(S1) * \Pr(B S1)$</div>																																		

Baye’s rule

	S1	S2	
Good	0.637	0.3325	0.9695
Bad	0.013	0.0175	0.0305
	0.65	0.35	1

	S1	S2	
Good	$0.98 \times 0.65 = 0.637$	$0.95 \times 0.35 = 0.3325$	0.9695
	P(G S1) × P(S1)	P(G S2) × P(S2)	P(G)
Bad	$0.02 \times 0.65 = 0.013$	$0.05 \times 0.35 = 0.0175$	0.0305
	P(B S1) × P(S1)	P(B S2) × P(S2)	P(B)
	0.65	0.35	1
	P(S1)	P(S2)	

- $$P(S1 | B) = \frac{P(B | S1) \times P(S1)}{P(B)}$$

Bayes' Rule

$$P(X|Y) = \frac{P(Y|X) \times P(X)}{P(Y)}$$

- But $Pr(S1 \cap B) = Pr(S1) * Pr(B|S1)$, and
- $Pr(S2 \cap B) = Pr(S2) * Pr(B|S2)$

$$\Pr(S1|B) = \frac{\Pr(S1) * \Pr(B|S1)}{\Pr(S1) * \Pr(B|S1) + \Pr(S2) * \Pr(B|S2)}$$

- $$P(B) = P(B | S1) \times P(S1) + P(B | S2) \times P(S2)$$

- ## Baye's rule

$$\begin{aligned}\Pr(S1|B) &= \frac{\Pr(S1) * \Pr(B|S1)}{\Pr(S1) * \Pr(B|S1) + \Pr(S2) * \Pr(B|S2)} \\ &= \frac{0.65 * 0.02}{0.65 * 0.02 + 0.35 * 0.05} = 0.426. \\ \Pr(S2|B) &= 0.574.\end{aligned}$$

- Significance: Find posterior probabilities using prior information.
- Notice that we use $Pr(B/S1)$ to find $Pr(S1/B)$.

	S1	S2	
Good	$0.98 \times 0.65 = 0.637$	$0.95 \times 0.35 = 0.3325$	0.9695
	$P(G \mid S1) \times P(S1)$	$P(G \mid S2) \times P(S2)$	$P(G)$
Bad	$0.02 \times 0.65 = 0.013$	$0.05 \times 0.35 = 0.0175$	0.0305
	$P(B \mid S1) \times P(S1)$	$P(B \mid S2) \times P(S2)$	$P(B)$
	0.65	0.35	1
	$P(S1)$	$P(S2)$	

- **So, Prior was:**
 - $P(\text{a randomly picked item was from } S_1) = 65\%$
 - $P(\text{a randomly picked item was from } S_2) = 35\%$
- **Posterior:**
 - $P(\text{a randomly picked item was from } S_1 \mid \text{given that the item was bad}) = 42.6\%$
 - $P(\text{a randomly picked item was from } S_2 \mid \text{given that the item was bad}) = 57.4\%$

	<ul style="list-style-type: none">• So we have found association between two categorical variables:<ol style="list-style-type: none">1. Supplier (s1 & S2), and2. Quality (good and bad)
