Transformations

We apply log-log transformation in Constant Elasticity Model to convert it into SLR equation.

[Math Processing Error]

Take log

$$\log(D) = \log(C) - \epsilon \log(p)$$

Compare with

$$y = \beta_0 + \beta_1 x$$

then

$$\begin{aligned} y = \log(D) &\rightarrow \text{Response variable} \\ x = \log(p) &\rightarrow \text{Explanatory variable} \\ \beta_0 = \log(C) &\rightarrow y\text{-intercept or market-size} \\ \beta_1 = -\epsilon &\rightarrow \text{Slope} \end{aligned}$$

and

$$\begin{aligned} \therefore C = e^{\beta_0} = D(1) &\rightarrow \text{Demand when price} = 1. \\ \epsilon = -\beta_1 &\rightarrow \text{Elasticity value.} \end{aligned}$$

Revenue maximizing price

$$p^* = -\frac{D(0)}{2m}$$

Profit maximizing price

$$p^* = \frac{D(0) + mc}{2m}$$

Primal-Dual

Mean Squared Error,

$$MSE = \frac{1}{n} \sum_{i=1}^n (y_i - \hat{y}_i)^2$$

Root Mean Squared Error,

$$RMSE = \sqrt{MSE}$$
